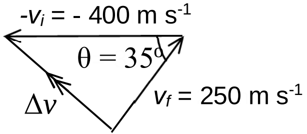
<tr><td></td><td></td><td>B is precise but not accurate
D is not precise and not accurate</td></tr>
<tr><td>2</td><td>B</td><td>

$\Delta v = v_f - v_i = v_f + (-v_i)$



$(\Delta v)^2 = 250^2 + 400^2 – 2(250)(400)\cos 35^0$
Δv = 242 m s^{-1}

Note: The <u>negative sign</u> of 400 MUST be removed in the calculation as the 400 represents the length of one side of the triangle which cannot be negative.

</td></tr>
<tr><td>3</td><td>D</td><td>From t = 0 s to point X, car is accelerating (speeding up). Hence, greatest velocity is at X. From X to Z, car is decelerating (slowing down) but still</td></tr>
