6.	**Ans: B** For an ice cube floating on sea water, its weight = upthrust, so 0.920 g cm^{-3} x 1.00 cm^3 x g = 1.03 g cm^{-3} x volume of sea water displaced x g So volume of sea water displaced = 0.893 cm^3 let the volume of water from melted ice be v , by conservation of mass, we have 0.920 g cm^{-3} x 1.00 cm^3 = 1.00 g cm^{-3} x v v = 0.920 cm^3 So volume of liquid increases by 0.920 – 0.893 = 0.03 cm^3
7.	**Ans: D**
