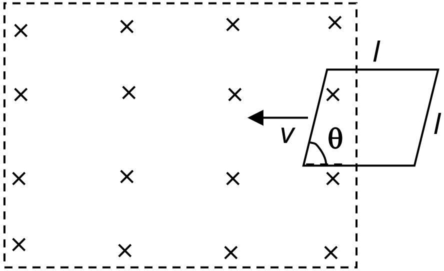
Answer : B

**24** A wire frame in the shape of a parallelogram of sides *l* enters a magnetic field with flux density *B* as shown in the figure.



If the total resistance of the wire frame is *R*, what is the value of the induced current in the wire frame at the instant shown?

**A** 0 **B** $\dfrac{Blv}{R}$ **C** $\dfrac{Blv\sin\theta}{R}$ **D** $\dfrac{4Blv\sin\theta}{R}$

Answer : C

**25** In the diagram shown, the **average** power dissipated across a 2.0 Ω resistor is 50 W.
