20	**A** Rate of arrival of electrons per unit area = number of electrons per unit time per unit area	**E**

	$= \dfrac{n}{tA}$, where n is the number of electrons, t is time and A is area Since current, $I = \dfrac{ne}{t} \quad \Rightarrow \quad \dfrac{n}{t} = \dfrac{I}{e}$ Therefore, rate of arrival of electrons per unit area = $\dfrac{I}{eA}$
