22	**A**	$I = nevA$ $v = \dfrac{I}{neA}$ $= \dfrac{I}{ne\pi\left(\dfrac{d}{2}\right)^2}$ $v \propto \dfrac{1}{d^2}$ If d increases linearly with position x, $d \propto x$. $v \propto \dfrac{1}{x^2}$ When x increases, v decreases at a decreasing rate.
23	**C**
