emf and hence induced current in ring. Therefore, ring drops back.

27 **Ans: B**

When the current from the a.c. sources travels from left to right through the external circuit (during first half cycle), I = EMF / total R = 12 / (4000 + 4000) = 1.5 mA.

When the current from the a.c. sources travels in the other direction (second half cycle), I = EMF / total R = 12 / (6000 + 6000) = 1.0 mA.

Hence, average current through ammeter = (1.5+1.0)/2 = 1.25 mA

28 **Ans: C**
