14. The specific latent heat of vaporization of water at 20°C is appreciably greater than the value of 100°C.

This is because

A The molecules in the liquid are more tightly bound to one another at 20°C than at 100°C.

B More work must be done in expanding the water vapour against atmospheric pressure at 20°C than at 100°C.

C The root mean square speed of the vapour molecules is less at 20°C than at 100°C.

D The specific latent heat at 20°C includes the energy necessary to raise the temperature of one kilogram of water from 20°C to 100°C.
