16	**B**	Resolution or Rayleigh questions necessarily involve small angles. $\theta_{\text{min}} = \dfrac{\lambda}{b}$ If angle of θ subtended at the opening by the two sources is greater than θ_{min} , the two images will be resolved (distinguished on the screen). This means that in order to make the separation of the images clearer, we can either increase θ or reduce θ_{min} .  Options A and C actually increases θ_{min} while keeping θ constant. This would make the images less resolved. Option D does not affect either θ_{min} or θ so it should have no effect on the resolution of the images. For option B, by reducing *D*. the angular separation θ increases for the same θ_{min} , thus the images are better resolved.
17	**A**	Using $d \sin\theta = n\lambda$
