		will follow the equation of $-NBA\omega\cos(\omega t)$
29	**B**	When the potential at X is higher than the potential at Y, the total resistance in the circuit is R_1. Current flows from X to Y. Similarly, when the potential at Y is higher than the potential at X, the total resistance in the circuit increased to R_1 + R_2. Current flows from Y to X (opposite direction) and has a lower peak value compared to when it flows from X to Y.

30	C	The energy of the photon emitted corresponds to the transitions between the
