3	**C**	By conservation of energy, $\frac{1}{2}mv_{\mathrm{f}}^{2} = \frac{1}{2}mv_{\mathrm{i}}^{2} + mg\Delta h$ Since, the magnitude of the loss in gravitational potential energy is the same for stones P and Q, with the same initial kinetic energy, the stones will end up with the same magnitude of kinetic energy, implying they will hit the ground with the same speed.
