S/N	Answer	Explanation
1	**A**	Let t be the timing displayed on the students' stopwatch. True period = $t \div 9$ Mistaken period = $t \div 10$ Absolute error = $(t \div 9) - (t \div 10) = t / 90$ Percentage error $= (\text{Absolute error} \div \text{True period}) \times 100\%$ $= [\ (t / 90) \div (t \div 9)\ ] \times 100\%$ $= 10\ \%$ The mistaken period is smaller than the true period. Thus the error is "low".
2	**D**	$v_y = 0$, $a_x = 0$, $a_y = g$
