		B
25	**D**	When the bar magnet begin to fall through the solenoid, the flux linkage through the solenoid increases, inducing an e.m.f. in it. When the bar magnet falls out of the solenoid, the flux linkage through the solenoid decreases, inducing an e.m.f. in the opposite direction. As the magnet accelerates under gravity, the rate of change increases. Hence the magnitude of the induced e.m.f. is larger when the magnet falls out of the solenoid.
26	**D**	Same heating effect implies same power dissipated in the resistor, i.e. $P = I^2R$
