

- 2 (a) With a suitable definition of the unit of force, Newton's second law can be written as the following relationship

$$\text{force} = \text{mass} \times \text{acceleration}$$

for a body of constant mass.

Using this definition together with Newton's third law, deduce the principle of conservation of momentum.

- (b) In an experiment, an  $\alpha$ -particle of mass  $m$  and initial velocity  $v_0$  is directed head-on towards a stationary heavy nucleus of mass  $M$  from afar. The variations with time of the velocities of the  $\alpha$ -particle and the nucleus are shown in Fig. 2.1.

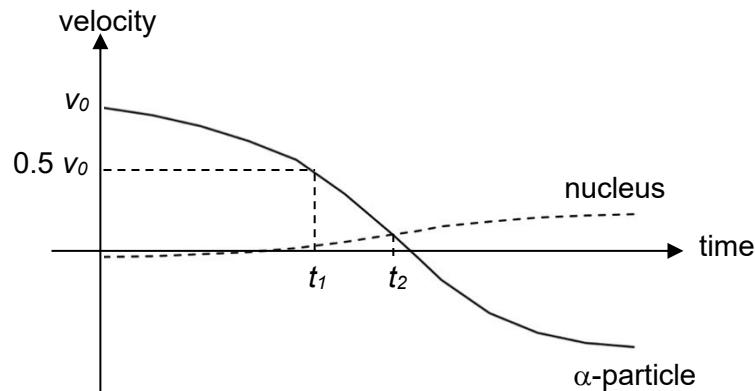

Fig. 2.1

- (i) Write down, in terms of  $m$  and  $v_0$ , an expression for the momentum of the nucleus at time  $t_1$ .

[1]

- (ii) Explain how you obtained the expression in (b)(i).

[2]

- (iii) The  $\alpha$ -particle is closest to the nucleus at time  $t_2$ . The velocity of the  $\alpha$ -particle at this time is  $v$ .

Determine the velocity  $v$  of the  $\alpha$ -particle in terms of  $m$ ,  $M$  and  $v_0$ .

velocity = ..... [2]

- (c) In a separate experiment, an alpha particle collides head-on with a stationary nitrogen-14 atom. The nitrogen atom moves off in the same direction as the approaching alpha particle with a speed of  $0.005 c$ , where  $c$  is the speed of light.

Discuss quantitatively whether the interaction is elastic in nature if the initial speed of the alpha particle is  $0.02 c$ .
