30 The equation

$$^{235}_{92}\mathrm{U} + {}^{1}_{0}\mathrm{n} \rightarrow {}^{121}_{45}\mathrm{Rh} + {}^{113}_{47}\mathrm{Ag} + 2\,{}^{1}_{0}\mathrm{n}$$

shows the fission of a uranium−235 nuclide by a slow-moving neutron into a rhodium-121 nuclide, a silver-113 nuclide and two neutrons.

binding energy per nucleon of $^{235}_{92}\mathrm{U}$ = 7.59 MeV

binding energy per nucleon of $^{121}_{45}\mathrm{Rh}$ = 8.26 MeV

binding energy per nucleon of $^{113}_{47}\mathrm{Ag}$ = 8.52 MeV

What is the energy released during this fission process?

A 9.19 MeV **B** 24.4 MeV **C** 73.9 MeV **D** 179 MeV
