

		- 0.18 mm
18	B	A: Correct. Electric field strength has both magnitude and direction. C: Correct. The electric field strength at a point in an electric field is equal to the negative of the potential gradient at the same point. $E = -\frac{dV}{dx}$. D: Correct. The electric field strength at a point in an electric field is defined as the electric force exerted per unit positive charge placed at that point. B: Incorrect. An example is: At a point equidistant from two unlike point charges of same magnitude (along the line joining the centres of the charges), the electric field strength is not zero. The electric potential is zero.
