

		For $\mathcal{E}$ to reduce, $\frac{d\Phi_B}{dt}$ can be reduced.
25	A	Applying Lenz's law, a North will be induced on the left side of the coil when the North pole is pushed into the left end; A South pole will be induced on the right side when South is pushed into the right end. Polarity of the induced B-field in the coil is the same for both cases. Since speed is halved, rate of change of magnetic flux linkage in the coil is less and a lower (e.m.f. and hence) current is induced.

Qn	Ans	Solution
26	C	$D = 100$
