

		$\Delta V = 8922 \approx 8.9 \text{ kV}$
29	D	Option A: The wavelengths of the characteristic peaks will change. Option B: No effect to spectrum P if the p.d. between cathode and target remains unchanged. Option C: The minimum wavelength of the spectrum will increase, in addition to reduced X-ray intensity in the continuous and characteristic spectrum.
30	C	Using $\Delta x \Delta p \geq h$
