

- 8** A sledge of mass 15 kg sits on a snowy surface. It is pulled horizontally at constant speed for 10 m against a frictional force of 60 N. Then it is pulled horizontally at constant speed across ice for 10 m. There is no friction between the ice and the sledge. It is lifted up vertically by 1.2 m and carried back at a constant speed to where it started.

At which stage of its journey is work done on the sledge greatest?

- A** being pulled 10 m across snow
- B** being pulled 10 m across ice
- C** being lifted up 1.2 m
- D** being carried back 20 m at constant speed

- 9 An escalator is 60 m long and lifts passengers through a vertical height of 30 m
