		$= 4x$
15	**D**	$\sin\theta_1 = \frac{(1)\lambda}{d}$ $\sin\theta_2 = \frac{(2)\lambda}{d}$ $\sin\theta_2 = 2\sin\theta_1$ The rate of increase of sin θ decreases as θ increases for θ from 0 to 90°. $\theta_2 > 2\theta_1$ At higher orders, since distance travelled by the light increases, intensity decreases.
16	**C**	$\theta = \frac{\lambda}{b} = \frac{x}{D}$
