20	**D**	Electric field strength at a point is equal to the negative potential gradient at that point.
21	**C**	$I = \frac{dQ}{dt}$ For the first 3 hours, $Q = (0.60)(3 \times 60 \times 60) = 6480$ C In the 4th hour, $Q = \frac{1}{2}(0.60)(1 \times 60 \times 60) = 1080$ C Total charge = 6480 + 1080 = 7.6×10^3 C
22	**D**	For the resistance to be constant, the graph must be a straight line that passes through the origin.
