		has a component downwards, the magnetic force is directed into the page.
25	**B**	Force on electron $= Bqv$ $= (2.0\times10^{-3})(1.60\times10^{-19})(3.0\times10^{6})$ $= 9.6\times10^{-16}$ N The electron undergoes uniform circular motion in the magnetic field as magnetic force provides centripetal force. The magnitude of velocity does not change, and hence kinetic energy does not change. Gain in energy is zero. The velocity of the electron changes as direction changes. Hence, change in momentum is not zero.
26	**C**	$\varepsilon = \frac{NA\Delta B}{\Delta t} = \frac{5\times\pi(0.060)^{2}}{(0.75-0.18)} = 0.0767$ V
