		The sum of the vertical component equals to the weight. Since the strings are almost horizontal, T must be greater than W.
4	**D**	By conservation of energy, loss in GPE = gain in GPE $mgh - 0 = \frac{1}{2}kx^2 - 0$ $x = \sqrt{\frac{2mgh}{k}}$ $= \sqrt{\frac{2(0.22)(9.81)(0.40)}{350}}$ $= 7.0 \times 10^{-2}$ m
5	**A**	As air resistance is negligible, the acceleration does not change. Time of flight remains the same, and with the same horizontal velocity, the horizontal
