	$T = 3mg$
10	**D**  Gravitational field strength is a vector and acts towards the centre of the mass. So, g_P and g_Q act in opposite direction at point X.

	$g_P = \frac{Gm}{d^2}$, $g_Q = \frac{G(2m)}{(2d)^2} = \frac{Gm}{2d^2}$ Thus, $g_{net} = g_P - g_Q = \frac{Gm}{2d^2}$ Gravitational potential is a scalar. So, the net gravitational potential is the algebraic sum of the individual potentials. $\phi_{net} = \phi_P + \phi_Q = -\frac{Gm}{d} + \left(-\frac{G(2m)}{2d}\right) = -2\frac{Gm}{d}$
