	is O.
24	**B** Applying Lenz's law, a North will be induced on the left side of the coil when the North pole is pushed into the left end; Hence, a South pole will be induced on the left side when South is pushed into the left end. Since speed is halved, rate of change of magnetic flux linkage in the coil is less and a lower (e.m.f. and hence) current is induced.
25	**A** Let PQ be a straight conductor;
