	Resultant torque = 85.0 × 3.2 × 4 = 1088 = 1090 N
7	**B** Kinetic energy of the steel ball remains the same as it is falling at constant speed. Hence, Options C and D are incorrect. The resistive force is constant as the speed of the steel ball remains constant. Hence gravitational potential energy decreases linearly. Option A is incorrect.
8	**C** (100 – 95)
