	efficiency $= \frac{}{4.0} \times 100\% = 75\%$
9	**D** Let the radius of the cord be *r*. When it moves to point P, it loses GPE and gains KE, $mgr = 1/2mv^2$ Speed at point P is therefore $\sqrt{2gr}$. At point P, the resultant force between tension *T* and weight *mg* provides centripetal force, so $T - mg = \frac{mv^2}{r} = \frac{m\left(\sqrt{2gr}\right)^2}{r} = 2mg$ $T = 3mg$
10	**D**
