15	**Answer: A**
	The Rayleigh Criterion is: $\theta = \dfrac{\lambda}{b}$ Let *x* be the distance between the two stars and *D* be the distance between the stars and telescope. $\dfrac{\lambda}{b} = \dfrac{x}{D} \Rightarrow \dfrac{580\times10^{-9}}{20\times10^{-2}} = \dfrac{x}{7.3\times10^{17}}$ $\therefore x = 2.117\times10^{12} = 2.1\times10^{12}\,\text{m (2.s.f)}$
