5	**Answer: D**
	Field lines should be perpendicular to metal plate surfaces. Therefore, options A and B are incorrect. At the bottom, the distance between the two metal plates is the shortest. At the top, the distance between the two metal plates is the longest. Since $E = -\frac{dV}{dr}$, field strength is strongest at the bottom and is represented by the closer field lines. Similarly, field strength is weakest at the top and is represented by the larger separation of field lines. Hence, option D is the correct option.
