x 0.25

9 **B** When the motor is not spinning, the 60 N mass will move downwards as there is a net downward force of 35 N.
Since the belt remains stationary when the motor is spinning,
$P_{output} = F_{net} \times$ (distance moved per unit time) $= F_{net} \times (20\pi d)$
$= 35 \times (20 \times \pi \times 0.35) = 770$ W

10 **C** Tension T provides centripetal force
