Question 4		
(a)	The minimas are nodes of the stationary wave / points where the incident and reflected waves meet in anti-phase / where destructive interference happen. The intensity of a wave emitted by a point source varies inversely with distance^2 / the amplitude of the wave varies inversely with distance. As plate moves rightward, the difference in intensity / amplitude between the incident and reflected waves becomes larger.	**B1** **B1** **B1**
(b)	Distance between nodes = 0.5 wavelength = 70 mm	**A1**
