		Weight of the satellte while in orbit is therefore $\frac{W}{36}$
10	**C**	For a uniform gravitational field, GPE = mgx E = mgx g = E/mx The direction *g* is from higher potential to lower potential, i.e. P to Q
11	**B**	Average K.E $= \frac{3}{2}kT = \frac{3}{2}(1.38 \times 10^{-23})(27 + 273.15) = 6.2 \times 10^{-21}$ J
