26	**D**	The I_{rms} of the square waveform is I_o. (working: $I_{rms} = \sqrt{\frac{I_o^2 \times \frac{T}{2} + I_o^2 \times \frac{T}{2}}{T}} = I_o$) The average power is given by $P = I^2 R = (I_o)^2 R$ When the current is doubled to $2 I_o$, the new I_{rms} is $2 I_o$. (similar working to above) The new average power is given by $W = I^2 R = (2 I_o)^2 R$ $= 4 (I_o)^2 R = 4 P$.
27	**B**	de Broglie's equation is
