		$= 4\left(I_0\right)^4 R = 4I^4$.
27	**B**	de Broglie's equation is $\lambda = \frac{h}{mv}$ $v = \frac{h}{m\lambda}$ Velocity is inversely proportional to its mass, as h and λ are constant in this question. For *v* to be the smallest, mass *m* has to be the largest, or nucleus with 2 protons and 2 neutrons (helium-4 nucleus) in this question.
28	**D**	momentum of a photon $p = \frac{h}{\lambda}$
