		and F must have the same units as $\sqrt{M}$, hence the units of F is kg$^{\frac{1}{2}}$.
2	D	Net force ($F=ma$) on object = Weight (W) – Air resistance R At the start, when $v=0$, air resistance = 0, thus $a = g$ As v increases, R increases, hence a decreases Thus, the acceleration on object decreases from g as it descends. When $R = W$, net force = 0 and so $a = 0$. The acceleration is zero and terminal velocity is reached.
3	B	Option B is a incorrect statement For elastic collision, the total ke before collision is equal to the total ke after collision, but
