		$I \propto x_0^n \Rightarrow \frac{I_1}{I_2} = \left(\frac{x_2}{x_1}\right)^n \Rightarrow \frac{x_2}{x_1} = \sqrt{\frac{I_1}{I_2}} = \sqrt{\frac{64}{1}} = \frac{8}{1} \Rightarrow x_2 = \frac{8}{8}$
15	**C**	Wavelength of closed pipe is $\lambda = 4L$, so speed of sound $v = f\lambda = 4fL$. Wavelength of open pipe corresponding to fundamental frequency $\frac{1}{2}f$, $\lambda' = \frac{v}{f/2} = \frac{4fL}{f/2} = 8L$ Length of open pipe $L' = \frac{\lambda}{2} = 4L$
16	**B**	Complete spectrum is considered using the longest wavelength since it lies furthest from the zeroth order max for the same order.
