|---|---|---|
| | | $\frac{dt}{E_0' = 2\pi NBA(2f) = 2 \times 2\pi NBAf}$ |
| **27** | **D** | Threshold frequency is related to the mininum energy required to release electrons from a metal surface which is independent of the intensity of light incident on it.<br><br>Increasing intensity results in more photons incident on the metal per unit time, so more electrons will be emitted. |
| **28** | **B** | When electrons are released by metal, it becomes positive. This causes the gold leaf to rise. |
