26 **D** $\frac{V_s}{V_p} = \frac{N_s}{N_p}$ → when N_p decreases, V_s increases (all else unchanged)

The other options are incorrect:

A: $E = NBA\omega\sin(\omega t)$ → when A decreases, E decreases.

B: $\frac{V_s}{V_p} = \frac{I_p}{I_s}$ → when I_p decreases, V_s decreases.

C: Has no effect on V_s, only has effect on I_s.
