		remains in the bottle which is 85%
11	**B**	Work is done on the air when it is compressed. The compression occurs rapidly, so there is little/no time for thermal energy to be transferred from the air to the surroundings; the compression is approximately adiabatic. The internal energy and hence temperature of the air increase sufficiently to ignite the paper.
12	**C**	In a uniform circular motion, the magnitude of the tangential velocity and the radius of the object remain constant
