		D: The amplitude of the stationary wave is equal to **two** times of the amplitude of one of the waves creating it.
18	**A**	For an open pipe, in order for standing waves to form $L = n\frac{\lambda}{2}$ Hence, given that wavelength is 20 cm, pipe R will be able to have a standing wave forming For a closed pipe, in order for stationary waves to form $L = (2n-1)\frac{\lambda}{4}$ Hence, pipe P will be able to have a standing wave forming.
19	**B**	At M, the electric potential energy of the particle will be
