24	**B**	For charged particles moving perpendicular in a magnetic field, the magnetic force will provide centripetal force and their radius will be $r = \frac{m}{q}\frac{v}{B}$ The electron will be deflected the most since the mass to charge ratio is the smallest and hence will be the one with the smallest radius, since speed and magnetic flux density is same for all.
25	**D**	Current in ammeter will be greatest when resistance is minimum and when the switch is open quickly, there will be a large rate of change of magnetic flux
