		smallest and hence will be the one with the smallest radius, since speed and magnetic flux density is same for all.
25	**D**	Current in ammeter will be greatest when resistance is minimum and when the switch is open quickly, there will be a large rate of change of magnetic flux through the soft iron, and hence larger induced e.m.f. and induced current.
26	**D**	$E = -\frac{dN\Phi}{}$
