		$\sin\alpha$
7	**C**	For an object dropped from a high building and air resistance being significant, It is expected for the velocity to increase at a decreasing rate due to net acceleration decreasing. Eventually, the object might reach terminal velocity. Hence graph Z will corresponds to the speed-time graph. X corresponds to the magnitude of the resultant force as it shows an initially constant force that decreases and then approaches zero. Gradient of Y increases from zero and reaches a constant value which matches the expected behaviour of the speed.
8	**D**	A: The weight of the ball continues to act throughout the collision. Gravitational force does not cease when the ball is in contact with the floor
