8	**D**	A: The weight of the ball continues to act throughout the collision. Gravitational force does not cease when the ball is in contact with the floor. B: Weight is a force, whereas momentum is *mv*. They are different physical quantities with different units, so their magnitudes cannot be directly compared. C: The contact force is greater than the weight during the collision, giving a resultant upward force that changes the ball's momentum from downward to upward. If the forces were balanced, there would be no change in momentum.
9	**A**	From conservation of momentum,
