5 **Ans: B**

**Total Initial Energy (at point P)**

For simplicity, set the PE at Q to 0 kJ. This means the PE at P is 50 kJ.

$$TE_P = PE_P + KE_P$$

$$TE_P = 50 + 5 = 55 \text{ kJ}$$

**Calculate the Final Energy (at point Q)**

$TE_Q = (PE_Q + KE_Q) + \text{Friction Loss}$

$55 = 0 + KE_Q + 10$

$KE_Q = 45$ kJ
