$$s = r \theta$$

$$\theta = \frac{s}{r} = \frac{25}{335 \times 10^3} = 7.46 \times 10^{-5} = 7.5 \times 10^{-5} \text{ rad}$$

$$\text{Minimum angle of resolution } \theta_m = \frac{\lambda}{b} = \frac{500 \times 10^{-9}}{200 \times 10^{-3}} = 2.5 \times 10^{-6} \text{ rad}$$

Images seen are resolved since angular separation between two sources is larger than the minimum angle of resolution.
