

as the air resistance is negligible when the velocity is small.

5

D

Consider horizontal direction, the change of momentum = $p \cos \theta - p \cos \theta = 0$
So average horizontal force = 0

Consider vertical direction,
Change in momentum = $p \sin \theta - (-p \sin \theta) = 2p \sin \theta$
Average vertical force = $\frac{dp}{dt} = \frac{2p \sin \theta}{t}$
