

20 A $E = -\frac{dV}{dx} = -(\text{gradient of } V - x \text{ graph})$

Arrangement 1 : E-field is uniform and hence the gradient of V-x graph should be constant.

Arrangement 2 : E-field decreases as we move from P to Q, hence the gradient of V-x graph should be become gentler as we move from P to Q.

21 C Bulk $X : R = 10^2 / 20 = 5.0 \Omega$
