

28 D Largest x-ray photon energy released $E = \frac{hc}{\lambda} = \frac{(6.63 \times 10^{-34})(3 \times 10^8)}{(0.02 \times 10^{-9})} = 9.945 \times 10^{-15} J$

For the electron to release this photon energy, it need to get eV amount of energy from the accelerating field.

$$(1.6 \times 10^{-19})V = 9.945 \times 10^{-15}$$

$$V = 62\,000 \text{ volt}$$
