

- 13 A rod PR of length L is turned about the point P through an angle θ .

The end R of the rod moves through a distance D . Both D and L are measured in metres.

What is the angle θ , expressed in radians?

- A** L/D **B** D/L **C** DL **D** $1/(DL)$

Answer: B

$$D = L\theta$$

$$\theta = (D / L) \text{ rad}$$

- 14 The gravitational potential ϕ along the line joining the centres of a planet and its moon varies
