

		on the coil is constant in magnitude throughout its rotation.
26	B	The p.d. induced between the centre and the edge of the disc is $V = BAf$, where A is the area of the disc, πr^2 . Hence, $V = B(\pi r^2)\left(\frac{\omega}{2\pi}\right) = \frac{1}{2}Br^2\omega$, where $\omega = 2\pi f$. Since $XY = \frac{r}{2}$, $V_{XY} = \frac{1}{2}B\left(\frac{r}{2}\right)^2\omega = \frac{1}{4}V$.
27	C	$N = V$
